

Introduction to Model Predictive Control for Discrete-time Dynamical Systems

Author: Jun Chen, Oakland University, USA

Optimize. Constrain. Control.

Model predictive control (MPC) has revolutionized modern engineering. This book offers a streamlined, accessible guide to MPC, specifically optimized for discrete-time systems.

We bridge the gap between complex mathematical theory and practical engineering reality. Through detailed explanations and real-world examples, you will learn to build robust algorithms that handle complex constraints with ease.

Key features:

- Clarity first: Designed for students and experts alike.
- Application-driven: Real-world problems, not just theoretical proofs.
- Discrete-time focus: Tailored for modern digital implementation.

Equip yourself with the expertise to tackle the most demanding control challenges in industry today.

TABLE OF CONTENTS

I Preliminaries

1 Introduction to Control Systems

2 Linear Systems

3 Numerical Optimization

II Linear MPC

4 Linear Quadratic Regulator

5 Linear Model Predictive Control

III Nonlinear MPC

6 Nonlinear Model Predictive Control

7 State Estimation

Appendix Linear Algebra

River Publishers Series in Automation, Control and Robotics

ISBN: 9788743813033

e-ISBN: 9788743813040

Available From: December 2026

Price: € 117.86

KEYWORDS:

Model predictive control, discrete-time systems, constrained optimization, optimal control theory, receding horizon control, state-space modeling, real-time optimization, feedback control systems
