Electrical Power and Artificial Intelligence

Editors:
Samuel Ratnajeevan H. Hoole,
K. Pirapaharan,
Paul R.P. Hoole

Electrical Power and Artificial Intelligence represent one of the fastest-evolving frontiers in modern engineering. Intelligent algorithms, autonomous systems, and advanced electrical technologies are reshaping industries ranging from energy, transportation, and manufacturing to healthcare, safety, and environmental sustainability.

This book explores the foundations of electrical power engineering alongside the growing role of artificial intelligence in power systems, devices, and intelligent energy applications. Rather than attempting an exhaustive treatment of the discipline, it provides a carefully selected introduction to emerging areas that demonstrate how rapidly the field is expanding and diversifying.

Topics include AI-driven control of electrical machines, intelligent wind energy systems, green energy technologies, sensorless motor control, electric and autonomous vehicles, optimization of energy storage systems, intelligent buildings, lightning protection, and smart electrical infrastructure. Special attention is given to practical engineering applications that connect theory with current industrial and research challenges.

Designed for postgraduate engineering students, researchers, and practicing professionals, this book serves both as an introduction to new developments and as a valuable refresher on the principles and frontiers of electrical power engineering. Through real-world examples and multidisciplinary perspectives, it highlights the growing influence of electrical, computer, and AI engineering in shaping the technologies of the future.

TABLE OF CONTENTS

- Electric Energy Resources and Green Energy
- Machine Learning for Wind Power Forecasting and Battery Energy Storage System Optimisation
- AI Data Center Challenges in Power and Sustainability with 50´ Power Demand Compared to Regular Data Centers
- AI-based Autonomous Ship Systems
- Double Rotor Single Stator Permanent Magnet Brushless Machines for Electric Vehicles
- Autonomous Uncrewed Marine Platforms
- Federated Digital Twin based Connected Autonomous Electric Vehicles for Green and Intelligent Transportation
- Fundamentals of Permanent Magnet Synchronous Motor Control Devices
- Electric Power Systems Devices and Components
- Environmental Electricity: Lightning and Lightning Protection
- Electric Energy Resources and Green Energy: A Case Study on Mapping of Solar and Wind Energies

River Publishers Series in Power

ISBN: 9788743812180
e-ISBN: 9788743812197
Available From: March 2027
Price: € 129.36

KEYWORDS:
Electric power, green transportation, machine intelligence, ship control, uncrewed navigation, motor control, brushless machines, artificial intelligence, lightning protection, wind power, renewable energy, data centers, visualization, machine learning, autonomous underwater vehicles, intelligent transportation
